Abstract Electrochemical synthesis, due to its environmentally benign, sustainable, and practical nature, has become an appealing and powerful substitute for traditional methods for oxidizing and reducing organic compounds. Thus, numerous valuable changes have been established in the field of organic synthesis through the utilization of electrochemistry. Among these electrochemical transformations, the formation of C–Se bonds stands out as an exceptionally noteworthy reaction type. In this graphical review, we present a succinct summary of the progress in utilizing electrochemical strategies for synthesizing organoselenium compounds.

Key words electrochemistry, organoselenium compounds, selenylation, difunctionalization, cyclization, cross-coupling

Organoselenium chemistry has remained a field of persistent exploration ever since selenium was recognized as an essential trace element within the human body. The significance of organoselenium compounds has experienced a substantial surge, particularly since the 1970s,

marked by the discovery of numerous intriguing compounds boasting diverse applications in synthesis and biology. Notably, among these compounds, diselenides have emerged as immensely valuable organic entities. The presence of Se–Se bonds confers their distinctive chemical attributes, enabling their involvement in a range of reactions as electrophilic (RSe^+), nucleophilic (RSe^-), or free-radical (RSe^\bullet) agents.

Over the past decades, advancements have propelled the synthesis of organoselenium molecules, a field often characterized by the routine utilization of costly catalysts and a variety of transition metals. This has spurred an ongoing quest to unearth more economical and environmentally friendly methodologies for generating selenium-containing compounds. Notably, recent breakthroughs in this pursuit have culminated in the development of an efficient and ecologically sound electrochemical selenylation process.

Electrochemistry has become an important strategy in organic synthesis, leading to the development of a multitude of beneficial transformations. One of its strengths lies in its capacity to induce carbon–carbon and carbon–heteroatom bond formation through anodic oxidation, all within an environment free from external oxidants. Notably, the domain of electrochemical synthesis has witnessed a surge in its utilization within the context of the formation of organoselenium compounds. Within the scope of this graphical review, our aim is to provide readers with an extended collection of instances exemplifying the utilization of electrochemical techniques in the synthesis of organoselenium compounds.

Biographical Sketches

Balati Hasimujiang was born in Xinjiang Province, P. R. of China. He earned his B.S. in 2011 and his M.S. in 2018, both from Xinjiang Normal University in 2011. In 2020, he joined the group of Prof. Ruan at the School of Pharmaceu-

tical Sciences, Guangzhou Medical University, where he performed his graduate studies and obtained his Ph.D. in June 2023. He is currently undertaking postdoctoral research in the laboratory of Prof. Ruan. His research inter-

ests focus on new methodologies in electrochemical synthesis, selenium chemistry, and the synthesis of biologically active compounds.

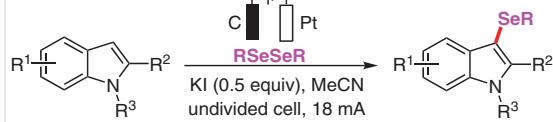

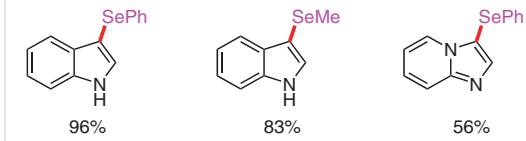

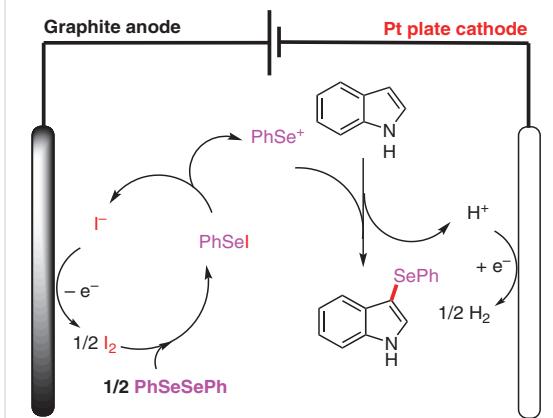

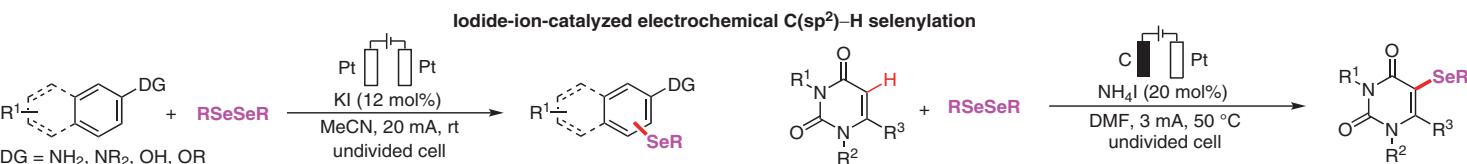

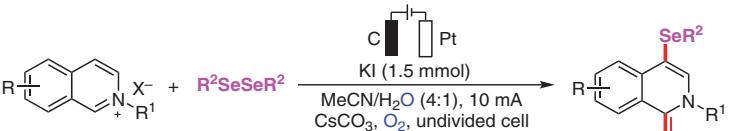

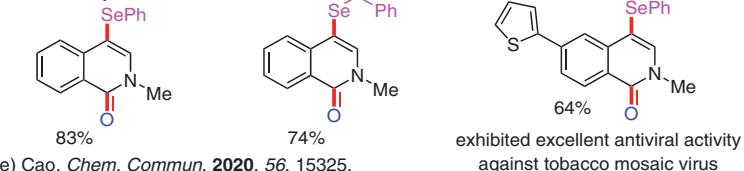

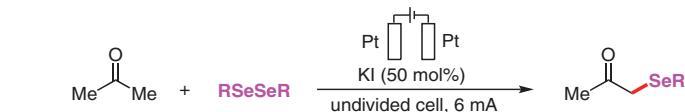

Zhixiong Ruan was born in Guangdong, P. R. of China. After obtaining his B.Eng. in pharmaceutical engineering at Guangdong University of Technology and his M.Sc. in medicinal chemistry at Jinan University, he joined the re-

search group of Prof. Dr Lutz Ackermann at Georg-August-Universität Göttingen, and obtained his Ph.D. in chemistry in 2017. He was subsequently employed as a professor at the School of Pharmaceutical Sciences, Guangzhou Medi-

cal University. His current research interests are focused on organic electrochemistry, peptide modification and synthetic medicinal chemistry.

Notable features

- Iodide salts employed as both electrolyte and catalyst.
- Electrochemical regioselective C(sp²)-H selenylation.
