 Copper-Catalyzed Enantioselective Borylative Allyl–Allyl Coupling of Allenes and Allylic *gem*-Dichlorides
 ACS Catal. 2023, 13, 5578–5583, DOI: 10.1021/acscatal.3c00536.

Enantioselective Copper-Catalyzed Three-Component Synthesis of *Z,Z*-Multifunctional-1,5-dienes

- 18 examples 40–82% yield (up to 97% ee and >20:1 dr)
- up to 1 mmol scale
- high chemo-, regio-, enantio- and diastereoselectivity

Selected examples:

Proposed reaction pathway:

Significance: The group of Fañanás-Mastral reports a highly chemo-, regio-, enantio- and diastereoselective copper-catalyzed synthesis of multifunctional internal 1,5-dienes. This reaction has a large functional group tolerance and the products could be easily transformed into more complex structure for example using coupling reactions.

Comment: The authors explain the high level of enantio- and diastereoselectivity observed in this transformation by non-convalent substrate–ligand interactions. This result is supported by DFT calculations.
