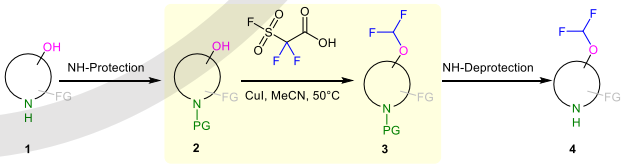
Abstract Fluorine-containing organic molecules, including CHF_2O-derivatives, are among the most sought-after in medicinal chemistry. In the current work, a mini-library of 21 compounds with a CHF_2O-motif incorporated with azetidine, pyrrolidine (proline), piperidine, 2-azabicyclo[2.2.1]heptane, and 8-azabicyclo[3.2.1]octane cores were synthesized. A multigram scale (10 to 30 g) procedure for synthesizing title compounds from commercially available amino alcohols was studied.

Key words Fluorine; difluoromethoxy group; azetidine; pyrrolidine; proline; piperidine; building blocks.

Fluorinated organic compounds are widely used in life sciences, agrochemicals, and materials science due to the unique properties of fluorine atoms.[1-3] Their strong electronegativity, small size, and capability to form weak intermolecular bonds offer manifold benefits for customizing vital parameters of the target molecule. Fluorinated fragments are commonly used to adjust a compound's physicochemical properties and enhance its biological properties, such as affinity or metabolic stability.[4-9] Among many other fluorine moieties, the CHF_2O group stands out for its ability to exhibit dynamic lipophilicity. It depends on the chemical environment and can be changed by simply rotating the bonds.[10,11] The CHF_2O functional group possesses a hydrogen atom that can readily form an extra hydrogen bond within the binding site, thereby contributing to its distinct properties.[3] These properties have led to an increasing interest in the synthesis of compounds containing this group in the last decade.

For aliphatic alcohols, only a few methods are available for their transformation to the CHF_2O group. These include difluoromethylation using 2,2-difluoro-2-(fluorosulfonyl)acetic acid[12], conversion of formic acid ester[13], the O-difluoromethylation through a S-difluoromethyl sulfonium ylide[14,15] and desulfurative fluorination.[16,17] The introduction of the CHF_2O group was achieved using (bromodifluoromethyl)trimethylsilane.[18-20] The first and last methods are preparative and scalable, but the difference in starting material price ($694.6/mol for (bromodifluoromethyl)trimethylsilane vs. $204.69/mol for 2,2-difluoro-2-(fluorosulfonyl)acetic acid due to the current lowest prices at the https://www.emolecules.com/) makes the multigram synthesis of CHF_2O derivatives using 2,2-difluoro-2-(fluorosulfonyl)acetic acid more commercially attractive.

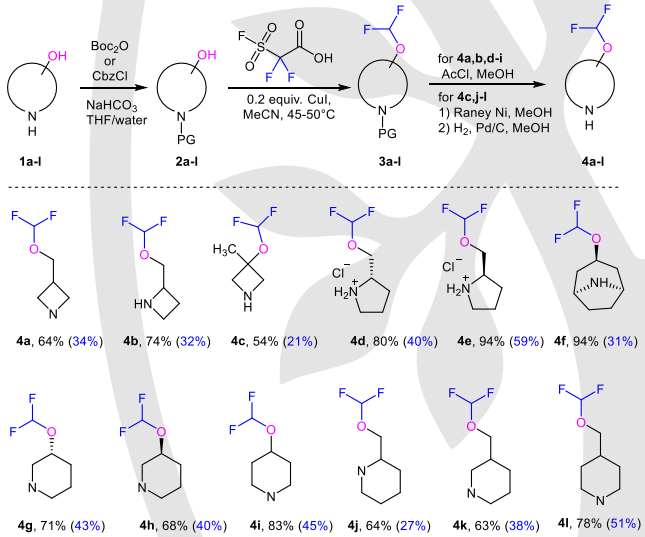
In this work, we used the approach, the key stage of which was CuI-catalyzed alkylation with the $FSO_2CF_2CO_2H$ N-protected functionalities of 4-6-membered saturated nitrogenous heterocyclic alcohols (Scheme 1). The introduction of the CHF_2O-group via the reaction of $FSO_2CF_2CO_2H$ with aliphatic alcohols was previously studied[21], but it was only applied in a limited manner to heterocyclic derivatives. In addition, there was limited data on the choice of protecting groups that would be tolerant of the reaction conditions and removed without leading to side products. Also, ways of incorporating additional functional groups, such as carboxyl to the second position of pyrrolidine, were investigated, which made it possible to obtain derivatives close to natural amino acids. Thus, in the current research, a mini-library of 21 compounds was synthesized via developed convenient methods.



Scheme 1. Proposed synthetic strategy

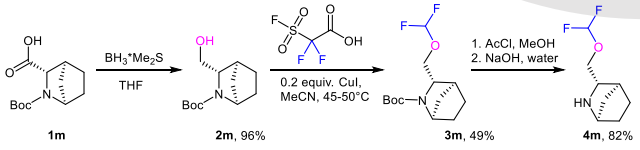
Initially, commercially available nitrogen tert-butyloxycarbonyl (Boc) protected alcohols of saturated heterocycle derivatives (Scheme 2) were tested in the previously elaborated reaction conditions. To compare protecting groups, we synthesized benzyloxycarbonyl (Cbz) protected derivatives. It is noteworthy

that, for several compounds, the replacement of the protecting groups has no significant influence. The reaction yields ranged from 39.6% for **3c** and 41.6% for **3j** to 65% for **3l**. It is noteworthy that the initial attempt at difluoromethylating the Boc derivative of 2c yielded a maximum of 15%. Replacing the Boc protecting group with Cbz significantly improved the yield. However, it remained below the average yield for this reaction. It is hypothesized that this is due to the steric effect. The final deprotection stage was conducted using acetyl chloride in a methanol solution for Boc derivatives or via catalytic hydrogenation in methanol at atmospheric pressure for Cbz derivatives. It is important to note that evaporation, particularly after the Boc deprotection process, must be carried out without overheating the reaction mass as the CHF_2O group is susceptible to hydrolysis to formate under acidic conditions. The catalytic hydrogenolysis of Cbz derivatives involved a two-step process: first, treatment with Raney nickel, followed by hydrogenolysis on palladium. This process was necessary to eliminate sulfur contamination in the starting material, which persisted even after two chromatographic purifications. The appearance of a distinct odor and slow or non-existent reaction during palladium-catalyzed hydrogenolysis confirmed the need for this step. After the reaction mass was treated with nickel, the reaction proceeded quickly under atmospheric pressure.



Scheme 2. Synthesis of compounds **4a-l**. The yields of the last stage and over two steps difluoromethylation and deprotection (blue in parentheses) are given

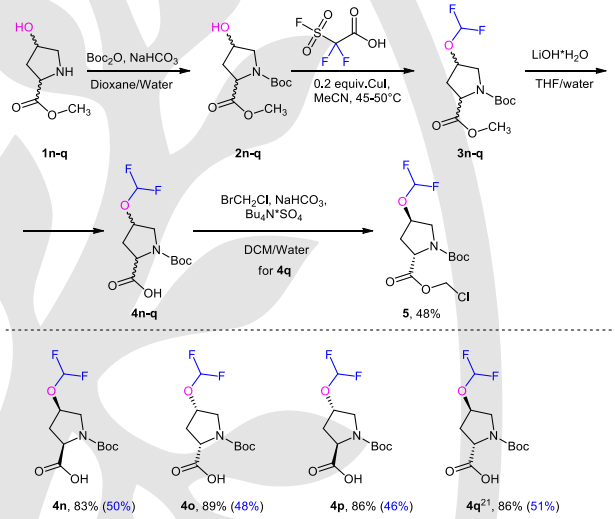
Alcohols of type **2a,b,d-f,** and **j-l** can also be obtained from commercially available amino acids. We demonstrated this approach by synthesizing compound **4m** (Scheme 3). At first, the available N-Boc-protected amino acid **1m** was reduced with a borane disulfide complex in high yield. Then, by the reaction of alcohol, **2m** with $FSO_2CF_2CO_2H$, a CHF_2O group was introduced in moderate yield. The final step was the Boc deprotection, which resulted in a high yield of 4m as hydrochloride.



Scheme 3. Synthesis of compounds **4m**

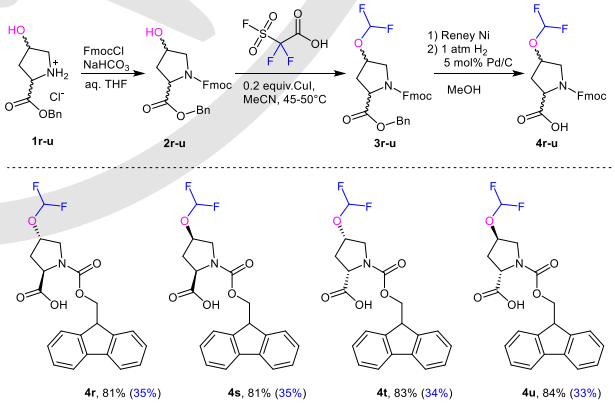
The possibility of designing multifunctional derivatives, such as CHF_2O-containing amino acids, was demonstrated by the preparation of compounds **4n-u**. All possible optical isomers of 1-(tert-butoxycarbonyl)-4-(difluoromethoxy)pyrrolidine-2-carboxylic acid **4n-q** and (2R,4S)-1-(((9H-fluoren-9-yl)methoxy)carbonyl)-4-(difluoromethoxy)pyrrolidine-2-carboxylic acid **4r-u** were obtained started from commercially available methyl and benzyl ester of 4-hydroxyproline isomers.

The synthesis of compound **4n-q** utilized Boc-amino methyl esters **2n-q**, prepared from available methyl ester **1n-q** (Scheme 4). Next, difluoromethylation and saponification steps underwent good or excellent yields. Finally, functionalization of the acid group on compound **4q** was performed, producing chloromethyl ester **5** with a moderated yield. Compound **5** is suitable for further modification by nucleophilic substitution reactions.



Scheme 4. Synthesis of compounds **4n-q.** The yields of the last stage and over two steps difluoromethylation and deprotection (blue in parentheses) are given

Likewise to the aforementioned acids **4n-q**, a set of optically pure fluorenylmethoxycarbonyl (Fmoc) protected amino acids **4r-u** was prepared. It is noteworthy that the difluoromethylation step yields CHF_2O derivatives **3n-q** in a range of 39.4% for **3u** to 43.5% for **3r**. Compared to the Boc and Cbz protecting groups, the Fmoc group was the least tolerant one, allowing the lowest yields. The final step of hydrogenolysis, as explained earlier, consisted of two stages: first, the Raney nickel treatment, followed by the hydrogenolysis stage, which yielded high results.



Scheme 5. Synthesis of compounds **4r-u.** The yields of the last stage and over two steps difluoromethylation and deprotection (blue in parentheses) are given

Thus, a mini-library of 21 compounds has been synthesized, comprising primary and secondary alcohol derivatives of azetidine, pyrrolidine (proline), piperidine, 2-azabicyclo[2.2.1]heptane, and 8-azabicyclo[3.2.1]octane. The protocol is suitable for multigram scale synthesis, useful for amino acid modification, and is tolerated by several protecting groups. We expect that current work will be valuable in the use of CHF_2O cyclic amine derivatives in drug development projects.

Compounds **1j (**CAS 3433-37-2**)**, **1k (**CAS 4606-65-9**)**, **1l (**CAS 6457-49-4**)**, **1m (**CAS 291775-59-2**)**, **1r (**CAS 153461-11-1**)**, **1s (**CAS 2140265-28-5**)**, **1t (**CAS 1864003-48-4**)**, **1u (**CAS 62147-27-7**)** are commercially available. Solvents were purified according to standard procedures. NMR spectra were recorded on a Bruker Avance DRX and on a Varian Unity Plus spectrometers at 25°C (for 1H at 500 MHz and at 400 MHz, for ^{13}C and ^{19}F at 126 MHz and 376 MHz, respectively). Tetramethylsilane (TMS) (for ^{1}H and ^{13}C NMR) and CCl_3F (for ^{19}F NMR) were used as internal standards. Mass spectra (ESI-MS) were recorded on an Agilent 1290 Infinity II LC System and an Agilent 1260 Infinity II LC System. The progress of reactions was monitored using TLC plates (silica gel 60 F254, Merck). Column chromatography was carried out on silica gel 60 (Merck, particle size 0.040–0.063 mm). Elemental analyses were correct within the limits of ±0.3%. Melting points were uncorrected. Compounds **1c**[30]**, 1p**[33]**, 2a**[22]**, 2b**[23]**, 2d**[24]**, 2e**[25]**, 2f**[26]**, 2g**[27]**, 2h**[28]**, 2i**[29]**, 2n**[31]**, 2o**[32]**, 2q–4q**[21] were previously characterized and obtained according to the procedures communicated elsewhere, see the literature below.

Procedures

Synthesis of compounds 2c, 2j and 2k (general procedure for Cbz-protection): Potassium carbonate (1.5 equiv.) was dissolved in water (2 mL/mmol) and the solution of appropriate alcohol amine in THF (1.7 mL/mmol) was added. The resulting mixture was cooled to 0°C in an ice bath and the solution of benzyl chloroformate (1.05 equiv.) in THF (0.3 mL/mmol) was added dropwise at 0°C. After the addition was completed, the resulting mixture was allowed to warm to room temperature and stirred overnight.

The reaction mixture was diluted with EtOAc and the organic layer was separated. The aqueous layer was extracted twice with EtOAc and combined organic layers were washed with brine, dried over Na_2SO_4, filtered, and concentrated in vacuo. The residue was purified by flash chromatography to obtain Cbz-protected amino alcohol.

Benzyl 3-hydroxy-3-methylazetidine-1-carboxylate (2c):

Purified by flash chromatography (hexane – MTBE 2:1).

Colorless thick oil. Yield: 75.5 g (70.3%)

Synthesis of tert-butyl (1R,3S,4S)-3-(hydroxymethyl)-2-azabicyclo[2.2.1]heptane-2-carboxylate (2m): Compound **1m** (80 g, 331.55 mmol) was dissolved in THF (800 mL) and borane dimethyl sulfide complex (62.9 mL, 663.1 mmol, 2 equiv.) was added dropwise at 20°C under an argon atmosphere. After the addition was completed, the resulting mixture was stirred overnight.

Aq. K_2CO_3 solution (247 g in 350 mL of water) was carefully added dropwise to the reaction mixture. After the addition was completed, the resulting mixture was stirred for 30 minutes. The organic layer was separated and the aqueous layer was extracted with MTBE (2*600 mL). Combined organic layers were washed with water (600 mL), brine (500 mL), dried over Na_2SO_4, filtered and concentrated in vacuo. The residue was purified by flash chromatography (hexane-EtOAc 2:1) to obtain compound **2m** (colorless thick oil, 72.9g, 95.8%).

^{1}H NMR (500 MHz, $CDCl_3$) δ 4.41 (s, 1H), 4.15 – 4.01 (m, 1H), 3.72 – 3.22 (m, 3H), 2.36 (d, *J* = 80.9 Hz, 1H), 1.75 – 1.62 (m, 2H), 1.62 – 1.52 (m, 2H), 1.44 (s, 9H), 1.23 (dd, *J* = 8.5, 6.0 Hz, 1H).

Synthesis of compounds 2r-u (general procedure for Fmoc protection): Corresponding compound **1r-u** dissolved in water (3.5 mL/mmol) and sodium bicarbonate (4 equiv.) was added. The resulting mixture was stirred for 20 min, and THF (3 mL/mmol) was added. The resulting mixture was cooled to 0°C in an ice bath, and the solution of fluorenylmethyloxycarbonyl chloride (1.15 equiv.) in THF (0.5 mL/mmol) was added dropwise at 0°C. After the addition was completed, the resulting mixture was allowed to warm to room temperature and stirred overnight.

The reaction mixture was extracted twice with EtOAc and combined organic layers were washed with water, brine, dried over Na_2SO_4, filtered and concentrated in vacuo. The residue was purified by flash chromatography to obtain the appropriate compound.

Synthesis of compounds 3a-u (general procedure for difluoromethylation): Protected amino alcohol was dissolved in MeCN (2.5 mL/mmol), and copper (I) iodide (0.2 equiv.) was added. The resulting mixture was heated to 45°C, and the solution of 2,2-difluoro-2-(fluorosulfonyl)acetic acid in MeCN (1 mL/mmol) was slowly added dropwise, maintaining the internal temperature below 50°C. After the addition was completed, the reaction mixture was heated at 45°C for 30 minutes.

The reaction mixture was concentrated in vacuo, and the residue was diluted with EtOAc and petroleum ether (1:1). The resulting mixture was filtered through a short SiO_2 pad, and the pad was washed with an additional amount of EtOAc and petroleum ether (1:1). The filtrate was concentrated in vacuo, and the residue was purified by flash chromatography.

Synthesis of compounds 4a, b, d-i, m (general procedure for Boc deprotection): Acetyl chloride (2 equiv.) was added dropwise to cooled MeOH (3 mL/mmol) at 0°C, and the resulting solution was stirred at 0°C for 20 minutes. A solution of an appropriate difluoromethoxy compound in MeOH (0.5 mL/mmol) was then added dropwise to the previous solution at 0°C. The resulting solution was allowed to warm to room temperature and stirred overnight.

The reaction mixture was concentrated in vacuo at 40°C, and Et2O was added to the residue. The resulting suspension was filtered, and the filter cake was washed with Et2O. The filter cake was dried in vacuo to obtain the appropriate product.

3-((Difluoromethoxy)methyl)azetidine (4a):

The crude product was treated with 20% NaOH and extracted with Et_2O. The organic layer was dried over Na_2SO_4, filtered, and concentrated in vacuo.

The catalyst was filtered off and the filtrate was concentrated in vacuo. The residue was re-dissolved in MeOH (2 mL/mmol) and 10% Pd/C (5mol%) was added. The resulting mixture was degassed and backfilled with hydrogen three times and the resulting mixture was hydrogenated at 1 atm (balloon) overnight.

The catalyst was filtered off and the filtrate was concentrated in vacuo. The residue was dissolved in MTBE and the resulting solution was washed with 2N NaOH solution. The organic layer was dried over Na_2SO_4, filtered and concentrated in vacuo. The residue was distilled in vacuo to obtain the appropriate product.

(2S,4R)-1-(*tert*-Butoxycarbonyl)-4-(difluoromethoxy)pyrrolidine-2-carboxylic acid (4q)[21]

White powder, mp 87°C. Yield: 9.79 g (86%)

Synthesis of compounds 4r-u (general procedure for benzyl deprotection): Corresponding compound **3r-u** was dissolved in MeOH (15 mL/mmol) and added to the suspension of freshly prepared Raney Ni (1g per 1g of compound) in MeOH (5 mL/mmol) and the resulting suspension was vigorously stirred overnight.

The catalyst was filtered off and the filtrate was concentrated in vacuo. The residue was re-dissolved in MeOH (15 mL/mmol) and 10% Pd/C (5mol%) was added. The resulting mixture was degassed and backfilled with hydrogen three times and the resulting mixture was hydrogenated at 1 atm (balloon) overnight.

The catalyst was filtered off and the filtrate was concentrated in vacuo. The residue was dissolved in aq. sodium bicarbonate solution and the resulting solution was washed twice with DCM. The aqueous layer was acidified with equimolar amount of sodium hydrosulfate. The resulting mixture was extracted twice with DCM. Combined DCM layers were dried over Na_2SO_4, filtered and concentrated in vacuo to obtain the appropriate compound.
