Key words

rubioncolin B  
 quinone methide  
 Diels–Alder reaction

**SYNFACTS**  
*of the month*

**Significance:** Rubioncolin B is isolated from the roots of *Rubia* species which are administered in Chinese medicine. The short synthesis depicted features the tautomerization of the *p*-quinone **I** to the *o*-quinone methide **J** which then undergoes an intramolecular Diels–Alder reaction to give the complex ring system of the target.

**Comment:** Natural rubioncolin B is racemic and the authors postulate that the tautomerization of *p*-quinone **I** to the *o*-quinone methide **J** and a subsequent Diels–Alder reaction may explain its biogenesis.
