

Asymmetric Strecker-Type Reaction of Nitrones Using Cyanohydrin

R¹ = Ph, PMP, 4-ClC₆H₄, 4-BrC₆H₄, 1-Naph, 2-Naph, Me, Cy, *t*-Bu
R² = Bn, Me, Ph, CHPh₂

Selected examples:

Significance: An asymmetric Strecker-type reaction of various nitrones with acetone cyanohydrin using a magnesium–(*R,R*)-tartramide complex was developed to successfully prepare optically active (*S*)- α -amino nitrile derivatives in excellent yield. Thereby, the acetone cyanohydrin serves as a less harmful and easy-to-handle synthetic equivalent of HCN and TMSCN.

Comment: The reaction mechanism is proposed to proceed as follows: first, the reaction of cyanohydrin and the (*R,R*)-tartramide with MeMgBr forms the corresponding bromomagnesium salts. The tartramide magnesium salt might be further deprotonated by DBU to form a magnesium ate-complex which coordinates the nitronone. Transfer of the cyano group from the cyanohydrin magnesium salt to the nitronone occurs from the *re* face, forming specifically the (*S*)-enantiomer.
